

NAME

aiff2riff – convert .aif(f) into .wav(e) files

SYNOPSIS

aiff2riff *[[infile] outfile]*

DESCRIPTION

Convert *infile* in the Audio Interchange File Format (AIFF, developed by Apple) into *outfile* in the Waveform Audio File Format (RIFF/WAVE, developed by IBM and Microsoft). Both store uncompressed audio data in a chunk-based container format. The main difference is that AIFF and WAVE employ the big-endian and little-endian byte order, respectively. *infile* and *outfile* default to **/dev/stdin** and **/dev/stdout**, respectively. The dash (-) is a shorthand for the default value.
