

NAME

stack – superimpose audio data

SYNOPSIS

stack *[[infile ...] outfile]*

DESCRIPTION

Superimpose the audio data from the given *infile*s and store the result in *outfile*. Shorter data (with respect to both the number of channels and sample points) is periodically repeated. All files must be in the *WAVE* format. The *infile*s and *outfile* default to **/dev/stdin** and **/dev/stdout**, respectively. The dash (-) is a shorthand for the default value.
