NAME

   tz tag – add ID3v2 metadata to .wav(e) files

SYNOPSIS

   tz tag [*infile* [*datafile* [*outfile*]]]

DESCRIPTION

   Add metadata in the ID3v2 format to the content of *infile* and store the result in *outfile*. The IDv3 metadata is provided via a UTF-8-encoded *datafile*, where each lines consists of an ID3 frame ID followed by a single space and the actual information, for example:

      TIT2 Explosion
      TALB Kapitulation
      TPE1 Tocotronic
      TYER 2007
      TRCK 12/12
      APIC Portrait_of_Douglass_Morgan_Hall.png

   Currently, only text-information frames, whose frame IDs start with "T", and an attached picture (APIC) are supported. Existing IDv3 metadata is overwritten. Tonbandfetzen metadata, namely the amplitude stored in the application-specific **APPL** chunk, is cleared. *infile* defaults to **/dev/stdin**. If nonexistent or empty, all metadata is cleared. *datafile* defaults to the filename stem of *infile* with the extension **.id3**. *outfile* defaults to *infile* where the possible substring **stdin** is replaced by **stdout**. The dash (**-**) is a shorthand for the default value.
