## NAME

tz aiff2riff – convert .aif(f) into .wav(e) files

## SYNOPSIS

**tz aiff2riff** [[*infile*] *outfile*]

## DESCRIPTION

Convert *infile* in the Audio Interchange File Format (AIFF, developed by Apple) into *outfile* in the Waveform Audio File Format (RIFF/WAVE, developed by IBM and Microsoft). Both store uncompressed audio data in a chunk-based container format. The main difference is that AIFF and WAVE employ the big-endian and little-endian byte order, respectively. Filenames default to **/dev/stdin** or **/dev/stdout**. The dash (**-**) is a shorthand for the default value.
